# What is YoVille?

- It's part of the Zynga Family of games that are amazingly popular on Facebook.

YoVille Population: 5 Million Active Players

# What is YoVille?

- Special thanks to Chris Peterson, VP of Application Security at Zynga.
- Zynga was aware of the security issues we brought to their attention

- A security fix for the issues we will discuss is in place
- The Facebook Application API can still be abused

# Roadmap

1) Introduction

2) Client-side trust attacks within Application APIs

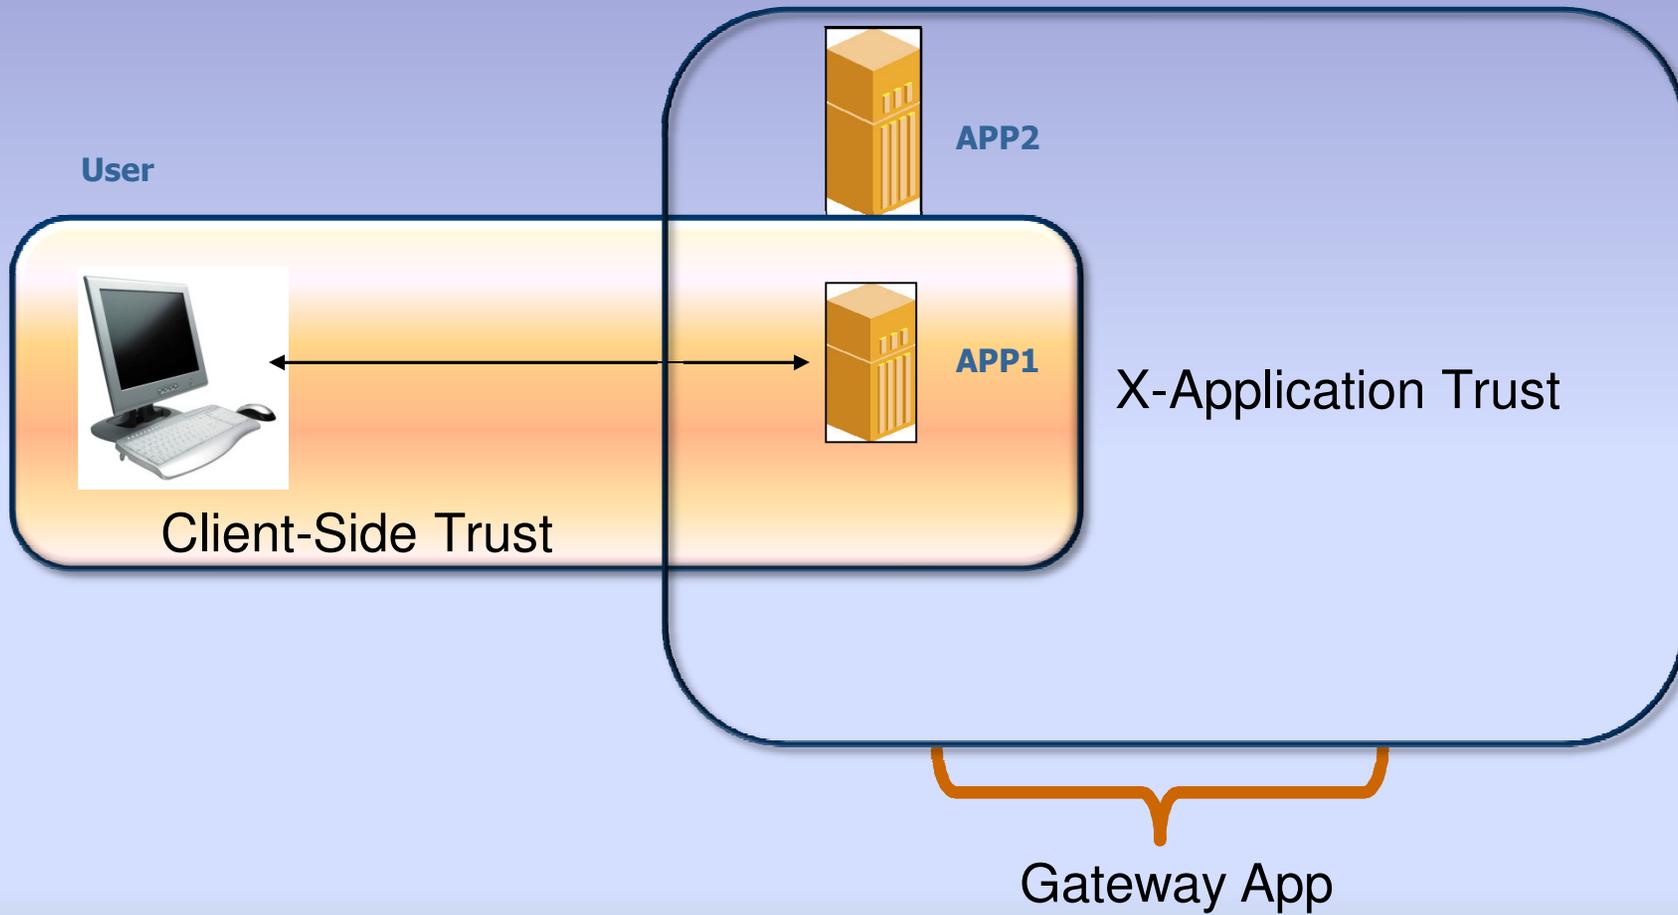

3) Attack Patterns Against Social Network Gaming

4) Impact of the attacks using YoVille as an example

5) How to keep your software off the stage at DEF CON

# Client-Side Trust

# Attack Characteristics

- ✓ Amplification: Attacker can use one compromised account to attack that users friends via social gaming.
- ✓ Deception: Phishers can create messages to lure users to click on malicious links or buttons, in some cases with the URI masked
- ✓ Easy to Exploit: By using a MITM proxy an attacker can create fake but legitimate looking prizes, gifts, or awards. Manipulating the API is trivial.

# Attack Characteristics

- ✓ Trust: Since the attacks often originate from in-game friends or neighbors there is a greater tendency to trust the content as legitimate
- ✓ Stealth: Because the attacks happen at the layer of application logic they are very difficult to detect (i.e. no noisy metacharacters or scripts).
- ✓ Urgency: Users are trained to quickly click and claim items their friends discover before the item expires or is used up.

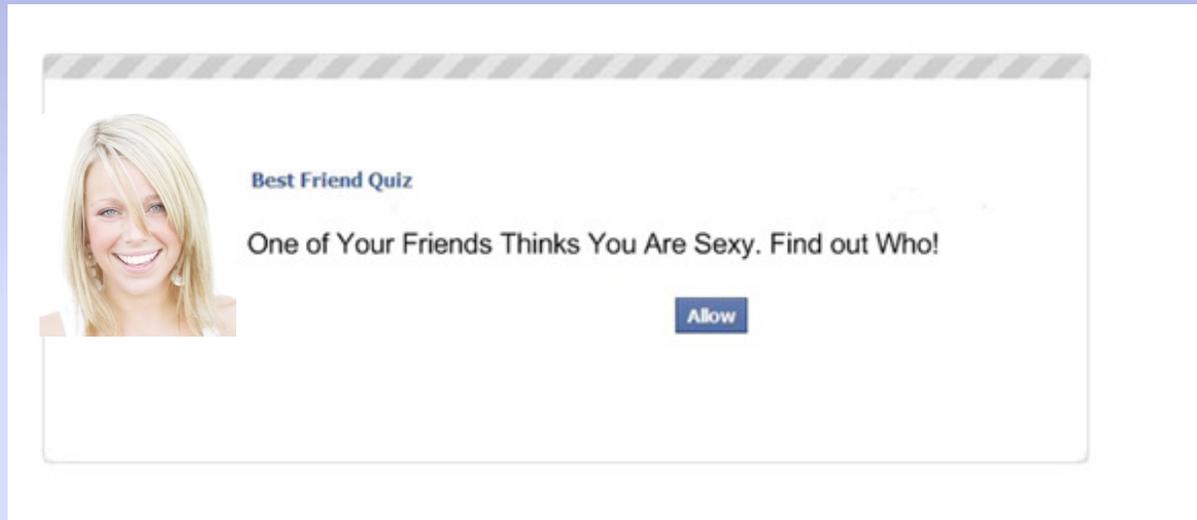

# Attack Patterns for Client-Side Trust

- 1) Application API Manipulation via Man-in-the-Middle
- 2) Application API Content Spoofing via API Manipulation
- 3) Transaction or Event Tampering via API Manipulation
- 4) Transaction or Event Replay via API Manipulation

# Attacks can prey on users interests or vanity

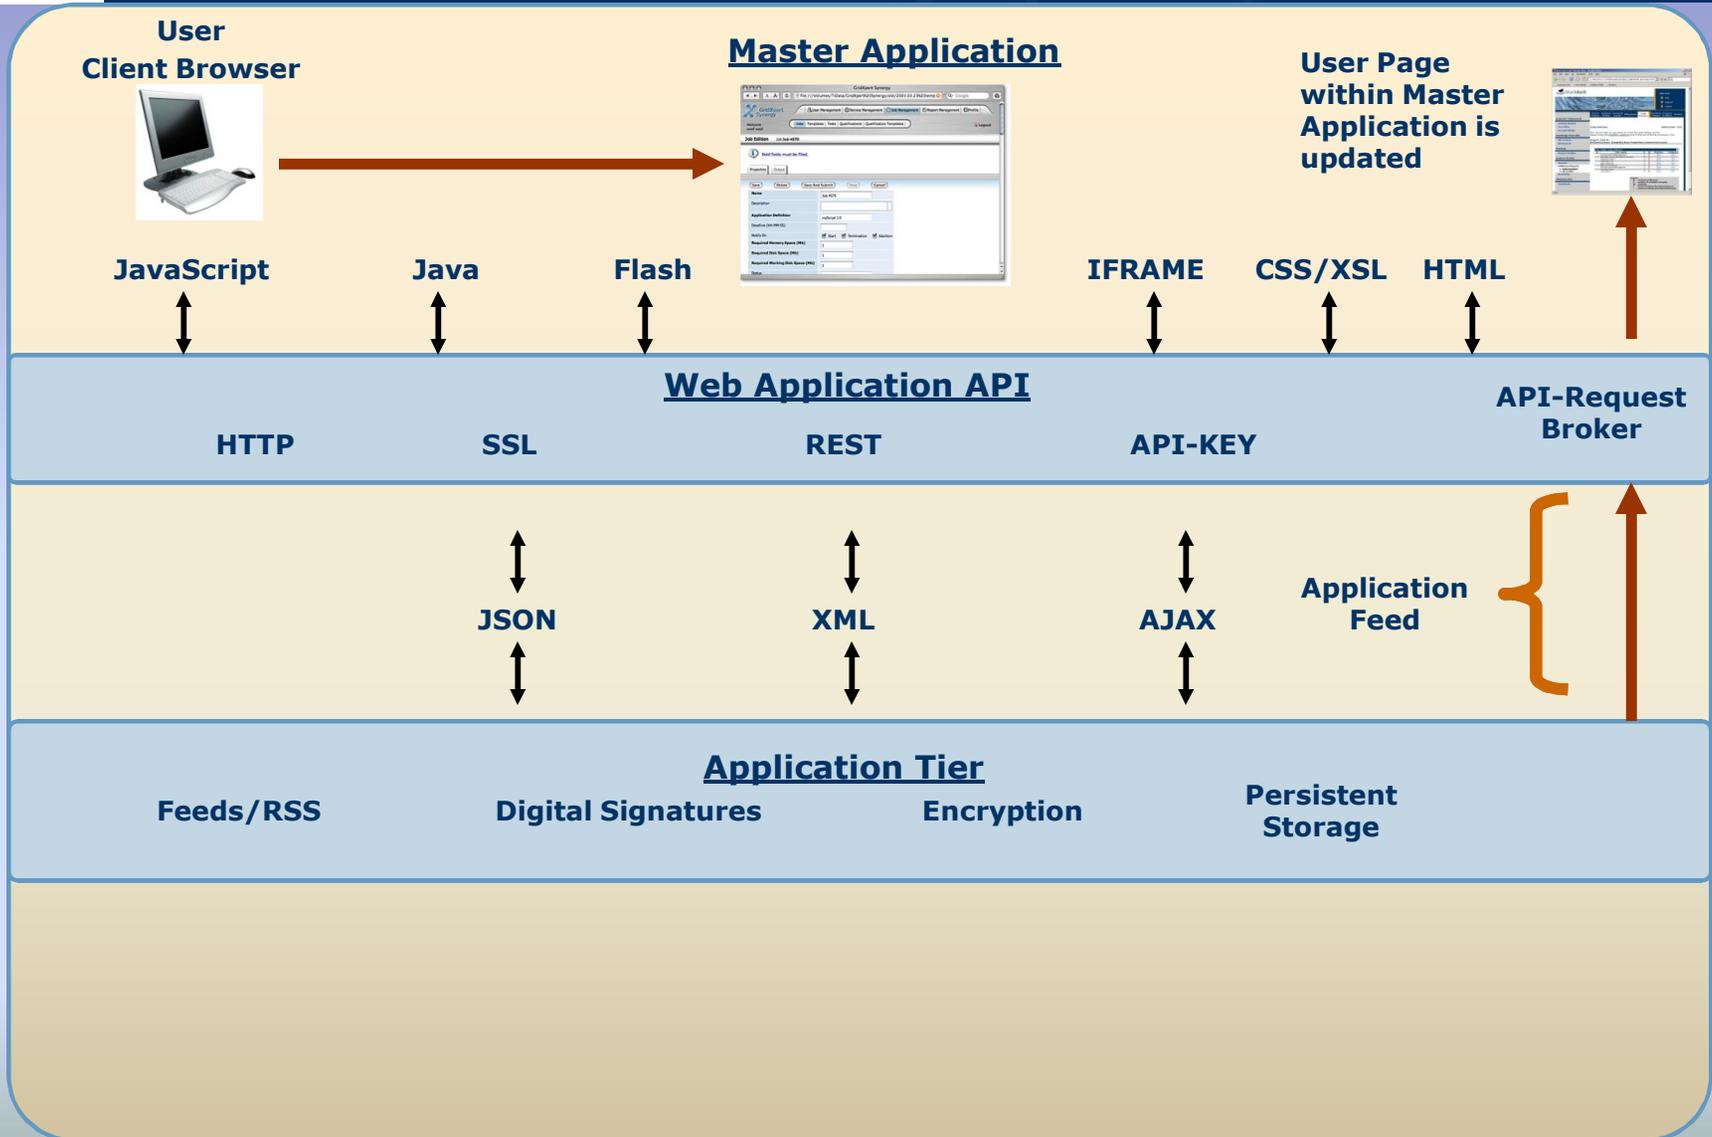

The best kind of lies are those we want to be believe...

Clicking Allow takes you to a Adobe PDF exploit

- ActiveX

# Application API Content Spoofing

**An attacker is able to modify message content or make API calls to create arbitrary content within cross-application Messages**

- **Root Cause:** Failure to protect data from modification (i.e. failure to ensure data integrity).
- **Impact:** Attacker can create deceptive content that enables social engineering attacks, phishing, or user harassment

9) Malware Propagation via Application API Message

# Application Trust Boundaries

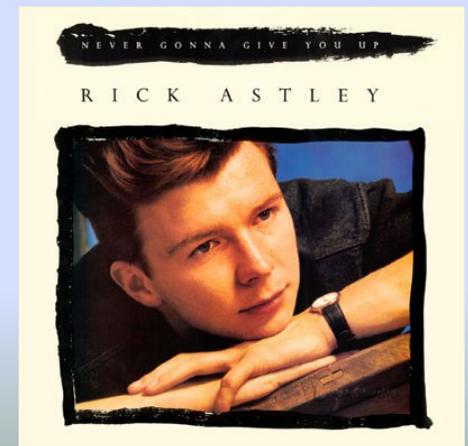

# Application API Navigation Remapping

**When web application links that should point back to the application or its content are rewritten to trick users into following a malicious link.**

- **Root Cause:** Failure to protect data from modification (i.e. failure to ensure data integrity).
- **Impact:** Potential compromise of user's machine and/or accounts via direct exploitation of browser or plugin flaws. Potential for spoofing, phishing, & authorization of malicious applications

# How to Keep Your Software off the Stage at DEF CON

To build secure software you **MUST** understand how it will be attacked

A broad understanding of the attackers perspective resides in the heads of a relatively small group of people - most of them are here this weekend

The only way to scale this knowledge is to capture and share it in a structured and standardized way

# Attack Patterns for Social Gaming
